Games. The story line starts at a remote cabin in the woods where the main character wakes up in a mysterious dream world. Throughout the game, he plays a part in the wake of a serial killer whose attacks occur in the small town where the player lives. The game also includes various collectibles with the player searching for clues and items that give them clues to the killer's identity.[2] Alan Wake PC - the homepage for Alan Wake PC. Trainer for FIFA 17 PC includes all data from FIFA 16 PC and all [Alan Wake] .The present invention relates generally to a system for generating and modulating magnetic fields and, more specifically, to a system for generating and maintaining a highly uniform and strong magnetic field by constraining the path of a high current flux and avoiding magnetic field disturbances that exist at regions of high current density. A well known problem with systems employing magnetic fields is field interactions. In general, magnetic fields tend to interact with each other, causing one field to null and modify the effect of other fields. For example, any electromagnet near a current carrying conductor will be demagnetized by the current in the conductor. The effect of this interaction is a reduction in the intensity and uniformity of the field. The effect is most noticeable in very strong electromagnets, commonly used to pull heavy loads in industrial applications. Similar difficulties can occur when attempting to generate a strong uniform magnetic field. The most common techniques for generating magnetic fields involve the use of rare earth magnets or the emittance of the field from large solid ferromagnetic masses. When using ferromagnetic magnets, the fields from the magnets are reoriented by providing a magnetization current in the magnets. One example of this method can be seen in U.S. Pat. No. 3,177,888, issued to Pelrine. In Pelrine, a plurality of electromagnets are made from magnetic ferrous elements and wrapped about a magnetic pole of a magnetizer. The electromagnet coils are energized with a direct current to provide a magnetic flux. The magnetic flux is directed through the magnetic pole so that the poles magnetize the ferrous material. When the ferrous material is sufficiently magnetized, a permanent magnetic field is stored in the material. While this method is relatively simple, the use of ferrous elements can induce eddy currents in the material. This can create localized disturbances, further reducing the uniformity of the field in the ferrous material. In Pelrine, the electromagnets are wrapped about the poles of a magnetizer, where the poles are made of a ferrous material. This ferrous material is therefore subject to the magnetic field interactions discussed above. Other systems, such as U.S. Pat. No. 3,275,207 1cb139a0ed
