It carried out conversion tasks fast
in our evaluation and had minimal

impact on the computer's performance, thanks to the fact that it required a low amount of CPU and RAM to work properly. No error dialogs popped up and it didn't hang or crash. However, it hasn't received updates for a long time. The bottom line is that Concord - Coordinate Converter facilitates a fast and easy solution for converting files between various airfoil types, so you can test it for yourself, since it's free for non-commercial use. Unfortunately, there are too many issues and bugs to give a good

rating. It doesn't import the data properly, and has many options to work with in case you need it. 0 of 1 people found this review helpful

What's New in the?

Coordinate Converter is an easy-to-use application that converts Rhinoceros DXF or ASCII airfoil files to Rhinoceros DXF or ASCII airfoil files. The program is able to

convert file formats that use the Coordinate Exchange Format (CEF), such as the Eppler FXPR airfoil, or the very popular version 0.94 (V Saero). You can also use it to convert to other file formats that use the PMARC, C-PEFS, and CMARC formats, as well as the Ian Kaynes KSC format and PC-airfoils. The program is only for creating Rhinoceros files. It does not work with other programs such as Autocad or GEO, nor does it work with other file formats such as XML or DXF. Concord -
