during a period of prolonged sleep and can result in a decrease of postnatal growth and wound healing. These effects can persist for many months, but most often disappear within few days after birth¹. More specifically, in our study, we demonstrated an impaired wound healing in offspring of MM pregnant rats that was correlated with altered serum glucose and insulin level. In the interpretation of our results, it has to be taken into consideration that Gcm1 and Sed1 and their metabolites can be converted in chylomicrons and VLDL. Therefore, besides the changes of the compounds directly coming from the active metabolism, an enhanced conversion of these lipid species to either higher- or lower-lipoprotein classes could also contribute to the increase in the VLDL/LDL ratio. Moreover, it is known that chylomicrons and VLDL can be directly internalized into adipocytes and hepatocytes, resulting in the accumulation of lipids in these organs². Our results suggest that the common factor for the three long-lasting endocrine alterations that occur during pregnancy is the gestational exposure to a high fat diet. The occurrence of these alterations during pregnancy seems to be a well established phenomenon³. As demonstrated by us, a high-fat diet during pregnancy has a long-lasting effect on glucose homeostasis. Specifically, we showed that the high-fat diet during pregnancy leads to an increase of the fasting glycemia of the offspring, which persists even in a situation of overnutrition. Furthermore, we showed that this increase of fasting glycemia was associated with changes in the pancreatic islets. We demonstrated an enhancement of islet area, an increased islet vascular density and an increase of the number of endocrine cells per islet in offspring of dams fed a high-fat diet during pregnancy. This was accompanied by an enhanced secretory response to glucose, indicating a possible improvement of the insulin secretory capacity of the pancreatic islets⁴. The presence of a high-fat diet is known to have adverse effects on pancreatic β cells⁵. In line with these results, an increase of pancreatic islet size, together with an enhanced vascular density, was also described as a phenomenon occurring in children of obese mothers⁶. Moreover, a

Det var i februar i fjor som politikere besluttet å fjerne plakaten. – Det vi stod på er en krangel der. Høyre har vært på krangeløftet og beskyldt dem som står for dette for å ha brydd seg for mye om det som kommer ut av oss, sier byrådsleder Raymond Johansen (Ap). Vi videreutviklet Dagsnytt 24 av plakaten og kunne fått den på bordet hjemme, men det skjedde aldri.
