Over time, the World of Link, both real and dream, grew into a realm very different from the original Hyrule. The King of Darkness, Ganondorf, also known as the Master of Nightmares, created a new race of creatures known as the Nightmares, whose sole purpose is to spread fear and destruction in Hyrule for him to rule as king. Zan took the form of a child, Mai, to begin his mission. Soon, Zan found himself lost in this mysterious new Hyrule, with only a figure that looked like Link by his side as his companion. Link and Mai soon were drawn into a confrontation with the Nightmares and their leader, Ganondorf, and were able to foil their plan for a new plague that would devastate both Hyrule and the Dream World... but at a terrible cost. The four are left battered and exhausted, but their triumph will not be forgotten by the people of Hyrule. Even the Nightmare King has no power here! Even in the world of Hyrule, don't give up! Smash through the enemies with strategy and master Link's powerful attacks. There's no need to worry about being hurt with ease! Being hurt doesn't mean you're defeated! In fact, this is probably more the case than for any other game genre. The only games I can think of in the past 10 years that still have genuine clannish RPGs are SimCity 2000, World of Warcraft, Final Fantasy XII and Final Fantasy XI. Heck, I think SimCity has two clannish/wargaming themes... it's just they were licensed games. If you look at like Super Mario Bros. or Pokémon, you'll see clannish games with genuinely less "clannish" flavors. Super Mario Bros for example has practically zero significance to the Mushroom Kingdom, outside of it being the continuity to Mario games. And even with Pokémon, you have the various butterflies that some people are obsessed with while others are obsessed with the Gyms. The game is also very diverse outside of it's original archetype. So in my experience it's not a genre that's at all rare. It's an IP that seems very niche to a larger audience, but if you break it down you'll see that it isn't. Such a network terminal typically comprises an interface, which is connected with a subscriber terminal or the like. The interface can be used, for example, for transmitting and receiving data via the transmission medium. Data which are transmitted and received from or to other network terminals are supplied and read out from a buffer memory. This buffer memory may be associated with the interface for storing data which are transmitted and received over the transmission medium. The buffer memory is used, for example, for temporarily storing data which have been transmitted or received as a response to a user request, until the data are written in a memory area designated by the user. In this connection, the buffer memory may comprise one or more memory areas. It is further possible that the data are transmitted and received on the basis of a time-shared transmission frame in time segments of short duration (high data speed), so that there is little need for a high-capacity buffer memory.
